2

### Plan Development Related to Sequencing

- ▶ Multi-disciplinary
- ▶ Communicate with contractors during plan development
- ▶ Add cushion to timelines. Understand the effects of timeline changes.
- ▶ Once grading begins, proceed systematically. Leap-frogging or start/stop
- ▶ Priority actions
- ▶ **CONTINGENCY PLAN**

5

### Timeline Changes and Contingency Plans

- ▶ **Murphy’s Law of Construction Delays**
  - Bid/spec/plan development/permit delays
  - Weather and climate change
  - Site conditions
  - Product availability
  - Equipment breakdowns
  - Contractor qualifications/capacities
  - Design/approach changes
  - Unknown variables

3

### Communications

- ▶ Engineers, landowners, consultants, contractors – daily or weekly meetings.
- ▶ Sub-contractors are often out of the loop.
- ▶ Develop streamlined communication systems.
- ▶ Project changes must not be just noted, but filtered through all aspects of the project and all contractors.

6

## Understanding the SWPP

- ▶ Site inspections to verify conditions after each phase of project work.
- ▶ Aspects of the SWPP should be developed by people with field experience in erosion control and vegetation management.
- ▶ SWPP should be flexible and address contingencies.
- ▶ Communicate with your SWPP

7

## Leap Frogging

- ▶ Product availability
- ▶ Contractor availability
- ▶ Expected results of decisions

10

## Plan Review

- ▶ Everyone on the same page?
- ▶ Good communication to keep EC/Veg contractors "on deck" – immediate seeding/EC products following final grading.
- ▶ Consider equipment ingress/egress.

8

Reacting to unknown variables

11

## Erosion Control Requirements Outside of the Design Plan

- ▶ Sediment control
- ▶ Erosion control
- ▶ Stormwater management
- ▶ Not all sediment control and stormwater management requirements can be depicted in the original design plan.
- ▶ Field communication is essential.

9

## Site Access

- ▶ Removing access before task completion
- ▶ Proper equipment
  - Low ground pressure vehicles

12

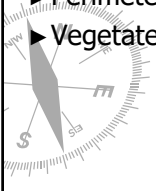

13

16

### Priority Actions

- ▶ Site Planning
- ▶ Site Inspection
- ▶ Identify areas of concern
- ▶ Perimeter control
- ▶ Vegetate slopes first

A compass rose is overlaid in the bottom left corner of the slide, showing cardinal directions and a scale.

14

17

15

18

19

### Soil Compaction Mitigation

- ▶ Measuring soil compaction
- ▶ Addressing Soil Compaction
  - Subsoiling
  - Ripper/Frost Tooth
  - Discing

22

20

23

21

24

**Effects of not addressing soil compaction**

25

28

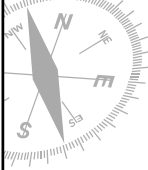

**Stormwater Runoff/Diversion**

26

**Cost Savings Through Proper Project Sequencing**

- ▶ Requires understanding of construction processes
- ▶ Get it right the first time
- ▶ Inspect the site before contractors leave

29

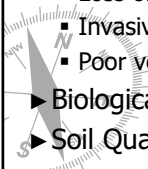

**Wood Slash**

- ▶ Addressing wood slash to achieve 70% vegetation cover
- ▶ Can be utilized as a temporary EC product

27

**Soil Impacts**

- ▶ Compaction
  - Erosion
  - Poor Infiltration
  - Loss of porosity
  - Invasive Species (soil disturbance)
  - Poor vegetation establishment
- ▶ Biological soil health
- ▶ Soil Quality (stockpiled topsoil)

30

31

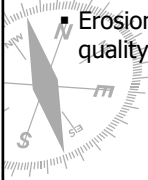

34

32

### Invasive Species

- ▶ Site history – what was growing on the site prior to the start of the project?
- ▶ Vectors of invasive species
  - Equipment (time to clean equipment?)
  - Erosion Control Product (time to acquire higher quality EC products?)

A compass rose is located in the lower-left quadrant of the slide, showing cardinal directions (N, S, E, W) and intermediate directions (NE, SE, SW, NW).

35

33

36

Tread Lightly during vegetation establishment phase.

37

► Stabilize the site but think about what comes next....

40

### Vegetation Impacts

- The Vegetation and Erosion Control Plan must be flexible
- Understanding phenology of target plant species
- Climate change (windows are changing)
- Inspections and maintenance considerations
- Misconceptions about using native vegetation to alleviate soil compaction
- Contingency Plans

38

**Lean in... and Think Outside the Box.**

41

### Seed Selections

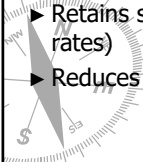

- Communicate the importance of strict adherence to seed specifications to all contractors and subs.
- Time to acquire high-quality seed?
- QA/QC - Time to verify seed specs are being followed?

39

### Polymer...the great equalizer

- Buys time
- Inexpensive
- Alleviates need for ECM installation and then removal later
- Binds seed to the soil
- Retains soil moisture (increases seed germination rates)
- Reduces soil erosion

42

43

### Temporary Cover Crops

- ▶ Rapid vegetation establishment is the best erosion control practice.
- ▶ Seed cover crops immediately (seed early and often on smaller sites).
- ▶ Add polymer on slopes, channelized flow/sheet flow
- ▶ Fast-establishing annual cool season species
  - Oats for growing season – best in spring. Will not overwinter
  - Annual rye for end-of-season or dormant season
  - Avoid wheat/triticale if natives are to be seeded

46

44

Don't wait until construction is complete to seed temporary cover crop

47

45

### Nurse (companion) Crops

- ▶ Planted with target seed mix
- ▶ Rapid root development of annual cover crop species paves the way for permanent cover species.
- ▶ Nurse crop species can fill niches otherwise filled by shallow-rooted non-native invasive species (NNIS).
